MM5483
Liquid Crystal Display Driver

General Description

The MM5483 is a monolithic integrated circuit utilizing CMOS metal-gate low-threshold enhancement mode devices. It is available in a 40-pin molded package. The chip can drive up to 31 segments of LCD and can be cascaded to increase this number. This chip is capable of driving a 4½-digit 7-segment display with minimal interface between the display and the data source.

The MM5483 stores the display data in latches after it is latched in, and holds the data until another load pulse is received.

Features

- Serial data input
- Serial data output
- Wide power supply operation
- TTL compatibility
- 31 segment outputs
- Alphanumeric and bar graph capability
- Cascade capability

Applications

- COPS™ or microprocessor displays
- Industrial control indicator

Note 1: “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of “Electrical Characteristics” specifies conditions of device operation.

Note 2: AC input waveform specification for test purpose: $t_r \leq$ 20 ns, $t_f \leq$ 20 ns, f = 500 kHz, 50% ± 10% duty cycle.

Note 3: Clock input rise and fall times must not excced 300 ms.

Note 4: Output offset voltage is ±50 mV with $C_{SEGMENT}$ = 250 pF, C_{BP} = 8750 pF.

Functional Description

A block diagram for the MM5483 is shown in *Figure 1* and a package pinout is shown in *Figure 2*. *Figure 3* shows a possible 3-wire connection system with a typical signal format for *Figure 3*. Shown in *Figure 4*, the load input is an asynchronous input and lets data through from the shift register to the output buffers any time it is high. The load input can be connected to V_{DD} for 2-wire control as shown in *Figure 5*. In the 2-wire control mode, 31 bits (or less depending on the number of segments used) of data are clocked into the MM5483 in a short time frame (with less than 0.1 second there probably will be no noticeable flicker) with no more clocks until new information is to be displayed. If data was slowly clocked in, it can be seen to “walk” across the display in the 2-wire mode. An AC timing diagram can be seen in *Figure 6*. It should be noted that data out is not a TTL-compatible output.
